

ITarian Remote Access

One of the benefits of the cloud and mobility is that computing can be done from anywhere. But when there's an issue, "anywhere" isn't a place you can get to so you can diagnose and fix the problem. Same goes for management of remote devices. Just as the users need to access network resources remotely, you need to be able to access and manage users' devices remotely. ITarian's Remote Access lets you do just that.

Remote Access allows you to;

- Administer devices connected to the network remotely
- Troubleshoot issues faster
- Access files located on devices or servers connected to the network
- Define accessibility rights to files for different categories of users
- Get faster access to files for more efficient business response.
